

Manlift Training Barrie

Manlift Training Barrie - There are lots of manlift training programs which offer a review of the manlift machinery. The practicum portion of the training is one more vital portion of the program. In this section the trainee has chance to demonstrate their practical abilities, their ability to safely operate a manlift. A prerequisite to Manlift training is the fall protection training, that could be incorporated in the training according to the specific requirements of the customer.

Course Content

The program content consists of: the impact of performing unsafe acts or operating unsafe machinery, pre-shift equipment check and work area survey requirements, Lifting device machine definitions, Review of load capabilities, the particular machine requirements and safety decals, Review of related parts of the OSHA Standards and the CSA Standards and Review site particular Dangers, together with controls for safe utilization of a lifting device.

Demonstration and Evaluation Content

Evaluation and demonstration content consists of: Proper personal protective equipment or also known as P.P.E. as needed; Using a signaler or a spotter when needed; Using the right fitting harness or fall arrest device; Using a lift only on level and solid ground; Using the lift with all other employees clear of the job location; Aware of load restrictions etc. and other specs as set out by the manufacturer; Pre-shift work area survey and equipment inspection; Having all associated machines safely stored on the lift platform; Ensuring a smooth and safe operating speed for different plant conditions and isolating off the work area when major work projects are to be done.

Every person would be tested to make certain they can safely and efficiently operate your site-specific machinery.

Manlift Safety

Since the manlift is capable of lifting materials and personnel over 20 feet in the air, these machines pose a particular amount of risk and can be dangerous machines if not used properly. Because the danger is so apparent, lift operators and owners are careful to properly maintain their machines and follow proper safety measures and operating procedures. The ratio of accidents involving this specific equipment is fairly low.

The safe operation of the boom lift, scissor lift and the manlift is up to the operator of that equipment. They must understand all of the responsibilities that go with running the machine and how to utilize the lift vehicle safely. The most basic safety features on the machine are safety decals and the operating handbook. These show important information regarding the operating procedures, safety machinery and maintenance.

A new model of manlift would come along with the needed decals in place and operating guidebooks. The operating handbook must be found on the equipment at all times. If you are purchasing a used lift, it is vital to make sure that the instruction manual is included and that essential decals haven't been painted over. The restraints that prevent operators from falling and the guardrails are other vital safety features. These are standard and mandatory on all types of lifts.
